COVID-19 Vaccine
For Children Ages 5 to 11

COVID-19 has reached a new demographic, and Pfizer-BioNTech has developed a vaccine specifically for children aged 5 to 11.

Health Canada has approved the Pfizer-BioNTech vaccine for children aged 5 to 11. The vaccine is administered in two doses, with the second dose given approximately 21 days after the first. The vaccine is 88.0% effective in preventing COVID-19 in children aged 5 to 11.

The vaccine is made from an mRNA molecule, which stands for messenger RNA. This type of vaccine encodes the protein that the body's cells need to make a spike protein that is found on the surface of SARS-CoV-2, the virus that causes COVID-19.
