

# Sub-meter to save water and money

Tap into the power of sub-meters to track water use and spot waste. Sub-metering gives you good data to:

- Find costly water leaks and fix them
- Identify and target exactly where water is wasted
- Build a smart environmental strategy to save water and money

## Sub-metering can benefit many types of organizations. Here's how...

### Industrial

- Babcock & Wilcox in Cambridge installed sub-meters to separate water use in their plant. That information helped them find improvements that **saved an estimated 1,580 m<sup>3</sup> per year**. That's over **\$7,500 in savings**.
- PlastiFab in Kitchener also installed digital sub-meters to measure industrial water uses. That data led to **950 m<sup>3</sup> of water savings** each year.

### Institutional

- If you manage many properties, sub-meters help you **spot unseen leaks and high water use**. Notice waste and fix problems before they get worse! The City of Kitchener and Waterloo Catholic District School Board, for example, use smart Flowie® devices that deliver live water data and automatic alerts.

### Commercial

- Strip malls and multi-unit apartment buildings can **divide water costs fairly** between each tenant. High water users are billed for what they actually use. Shutoff technologies are also available to **prevent major damage** in case of plumbing failure.
- Townhouses and other businesses can **spot whether water waste is from indoor or outdoor use**.
- Any property with different business uses can benefit by separating the two. Delta Hotel and Proof Restaurant in Waterloo, for example, use sub-meters to separate a swimming pool's high water use from the restaurant and hotel rooms.

The Region of Waterloo's Water Efficiency team can help you save water, cut costs and lower your environmental impact.
